                                                                                                                                                                                                                                                                    This invention comprises a method of purifying double-stranded DNA from a solution containing the double-stranded DNA mixed with other components, comprising passing the solution through a support comprising a covalently coupled oligonucleotide capable of forming a triple helix with the double-stranded DNA by hybridisation with a specific sequence present in the double-stranded DNA. The method is useful for purifying double-stranded DNA contained in a solution and mixed with other components. The new method is a simple, rapid and effective method for DNA purification, and makes it possible to obtain especially high purities with high yields. The method enables DNA to be purified from complex mixtures comprising other nucleic acids, proteins, endotoxins, nucleases and the like. The supports may be readily recycled, and the DNAs obtained display improved properties to pharmaceutical safety. Further, the method entails only one step contrary to prior art. The present sequence represents the (CTP)?
                                                                                                                                                                                                                        properties to pharmaceutical safety. Further, the method entails step contrary to prior art. The present sequence the oligonucleotide sequence which is capable of forming a triple he an oligonucleotide containing the complementary units GAA. This can be used in the DNA purification method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Purifying double-stranded (ds) DNA from a solution containing dsDNA and other components, comprises passing the solution through a support comprising a covalently coupled oligonucleotide able to form a triple helix with the dsDNA.
                                                                                                                                                                                               Sequence

                                                                                                                                                                                                               modified T cells that express proteins comprising (in an N-terminal to C terminal direction) single chain antibody binding domains (that bind to viral or tumour antigens), transmembrance domains and cytoplasmic signal transducing domains. When the single chain antibody domain binds to the viral or tumour antigen on the cell, the modified T cells kill cells expressing the antigens. The modified T cells are used for treating malignant diseases and viral infection especially by, human immunodeficiency virus (HIV), cytomegalovirus, hepatitis C, hepatitis B, and mycobacterium avium. The present sequence is a PCR primer used to amplify a nucleic acid encoding antibody mab 98.6 light chain variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   14-DEC-1990;

                                                                                                                                                                                                                                                                                                                                                               Composition for treating hormone-regulated cancer, particularly of prostate or breast, comprises oligonucleotide antisense to insulin-like growth factor binding protein-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 2002-339861/37.
                                                                                                                                                               of hormone-regulated tumours, particularly of breast or prostate, to the hormone-independent state, to delay metastatic progression to the bone of IGF-1-sensitive cancers and to treat hormone-responsive cancers by inducing apoptosis, after hormonal withdrawal. The present nucleic acid sequence represents one of a collection (ABK70313-ABK70375) of antisense IGFBP-2-oligodeoxynucleotides (ODN) that were used in the invention for
                                                                                                                                                                                                                                                     The present invention relates to a new composition for treating hormone-regulated cancer. The composition comprises an antisense oligonucleotide that inhibits expression of IGFBP-2 (insulin-like growth factor binding protein-2). The molecules of the invention are used to delay progression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       13-SEP-2001; 2001WO-US028748.

                                                                                                                                             This invention comprises a method of purifying double-stranded DNA from a solution containing the double-stranded DNA mixed with other components, comprising passing the solution through a support comprising a covalently coupled oligonucleotide capable of forming a triple helix with the double stranded DNA by hybridisation with a specific sequence present in the double-stranded DNA. The method is useful for purifying double-stranded DNA contained in a solution and mixed with other components. The new method is a simple, rapid and effective method for DNA purification, and makes it possible to obtain especially high purities with high yields. The method enables DNA to be purified from complex mixtures comprising other nucleic acids, proteins, endotoxins, nucleases and the like. The supports may be readily recycled, and the DNAs obtained display improved properties to pharmaceutical safety. Further, the method entails only one step contrary to prior art. The present sequence represents a DNA hybridisation sequence used to prepare a DNA purification column to purify the plasmid pXL2727-2 using the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC subject a sample nucleic acid containing a portion of at least 15 CC consecutive nucleotides of the segment of the COLIA1 gene extending in CC the 5' to 3' direction from 78 nucleotides of intron 27 located adjacent CC exon 28 through the 3' end of intron 51, where the portion contains an CC intronic nucleotide and a first and second site, determining the sequence of the portion with the CC corresponding consensus sequence of the COLIA1 gene where a difference CC between the sequence of the portion and the consensus sequence indicates CC the presence of the collagen alteration in the subject. The method is CC used for detecting abnormalities in a COLI or COL9 gene is useful for CC determining whether a subject is afflicted with pathological conditions CC associated with an altered collagen gene such as osteoporosis, multiple cepiphyseal dysplasia, osteogenesis imperfects, shortness of stature and CC abnormality. Indantification of an abnormality in a collagen gene is CC which can be administered to the subject to correct or alleviate the CC abnormality. The method is useful for detecting mutations in both the CC coding and non-coding sequences of any of the COL1 or COL9 genes.

Therefore the method can be used to detect collagen gene alterations of splicing of the mRNA encoding such chains or regulation of expression of the genes encoding such chains. The present sequence is a PCR primer CC which amplifies a nucleic acid from a collagen gene of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                          Composition for treating hormone-regulated cancer, particularly of prostate or breast, comprises oligonucleotide antisense to insulin growth factor binding protein-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hormone-regulated cancer; antisense oligonucleotide; IGFBP-2; insulin-like growth factor binding protein-2; hormone-regulated tumour; breast cancer; prostate cancer; IGF-1-sensitive cancer; apoptosis; hormone-responsive cancer; hormonal withdrawal; oligodeoxynucleotide;

                              The present invention relates to a new composition for treating hormone-regulated cancer. The composition comprises an antisense oligonucleotide that inhibits expression of IGFBP-2 (insulin-like growth factor binding protein-2). The molecules of the invention are used to delay progression of hormone-regulated tumours, particularly of breast or prostate, to the hormone-independent state, to delay metastatic progression to the bone of IGF-1-sensitive cancers and to treat hormone-responsive cancers by inducing apoptosis, after hormonal withdrawal. The present nucleic acid sequence represents one of a collection (ABK70313-ABK70375) of antisense IGFBP-2-oligodeoxynucleotides (ODN) that were used in the invention for
                                                                                                                                                                                                                                                                                       Composition for treating hormone-regulated cancer, particularly prostate or breast, comprises oligonucleotide antisense to insugrowth factor binding protein-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hormone-regulated cancer; antisense oligonucleotide; IGFBP-2; insulin-like growth factor binding protein-2; hormone-regulated tumour; breast cancer; prostate cancer; IGF-1-sensitive cancer; apoptosis; breast cancer; prostate cancer; hormonal withdrawal; oligodeoxynucleotide; browner-responsive cancer; hormonal withdrawal; oligodeoxynucleotide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        protein OmpA. The OmpA protein can be expressed by standard recombinant methodology. An antibody (Ab) specific to the OmpA polypeptide is useful for diagnosing an infection by R. anatipestifer in an avian species. The OmpA gene and protein are useful for the preparation of vaccines and serodetective diagnostic assays. A vaccine composition comprising the OmpA gene, protein or Ab is useful for effective immunization of poultry against R. anatipestifer infection, especially septicemia anserum excutativa. Sequences AAC85124-139 represent PCR primers used for
             The invention relates to Detecting a collagen gene alteration associated with a pathological condition in a human subject by obtaining from the subject a sample nucleic acid containing a portion of at least 15 consecutive nucleotides of the segment of the COLLA1 gene extending in the 5' to 3' direction from 78 nucleotides of intron 27 located adjacent exon 28 through the 3' end of intron 51 where the portion contains an extending the segment of the contains and the contains and
                                                                                                                                                                                                                                           Detecting collagen gene alteration, useful for diagnosing osteoporosis, multiple epiphyseal dysplasia, osteogenesis imperfecta, shortness of stature and low bone density in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    03-DEC-1991;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        associated with an altered collagen gene such as osteoporosis, multiple epiphyseal dysplasia, osteogenesis imperfecta, shortness of stature and low bone density. Identification of an abnormality in a collagen gene is also useful for designing a therapeutic nucleotide or gene therapy agent which can be administered to the subject to correct or alleviate the abnormality. The method is useful for detecting mutations in both the coding and non-coding sequences of any of the COLI or COL9 genes. Therefore the method can be used to detect collagen gene alterations which affect either the primary sequence of a collagen protein chain, splicing of the mRNA encoding such chains or regulation of expression of the genes encoding such chains. The present sequence is a PCR primer which amplifies a nucleic acid from a collagen gene of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             corresponding consensus sequence of the COLIA1 gene where a difference between the sequence of the portion and the consensus sequence indicates the presence of the portion in the subject. The method is used for detecting abnormalities in a COLI or COL9 gene is useful for determining whether a subject is afflicted with pathological conditions

This protein contains amino acids 1-662 of hPARPI fused upstream of amino acids 230-583 of hPARP2. The fusion protein coding sequence is given in AAC85341. The protein of the invention, hPARP2, causes the covalent addition of polymers of ADP-ribose to protein targets. hPARP2 activity is induced in many instances of oxidative stress or during inflammation where there is direct damage to the DNA. hPARP2 may be used to identify antagonists which may be used to treat a human having a disorder mediated by PARP2 activity, such as, inflammatory, neurological, cardiovascular, or neoplastic tissue growth disorders. hPARP2 and antibodies to it, can also be used to diagnose these conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     chronic glomerulonephritis; inflammatory bowel disease; Crohn's disease; ulcerative colitis; necrotizing enterpocolitis; inflammatory dermatosis; contact dermatitis; atopic dermatitis; psoriasis; urticaria; fever; myalgia; meningitis; encephalitis; Sjogren's syndrome; alcoholic hepatitis; bacterial pneumonia; hypovolemic shock; Type 1 diabetes mellitus; hypersensitivity; leukocyte dyscrasia; thermal injury; cytokine-induced toxicity; expressed sequence tag; EST; RACE; PCR; amplify; primer; polymerase chain reaction; ss.

RFLP analysis is carried out on the melanocyte-stimulating hormone receptor gene (MC1-R gene; AAR27046-AAR27049) and the c-KUIT gene (AAR27066-AAR27076). The method of the invention is used for distinguishing between coloured pig breeds including Hampshire, distinguishing, Monkai and Durock breeds, and between white pig breeds, including Landrace and large Yorkshire breeds. The method can distinguish between a wide variety of pig breeds. The present sequence represents a pig c-KIT gene PCR primer used in an exemplification of the

The PCR primers are used to amplify a C SNP flanking sequence, the SNPE primer is used as a genotyping primer. CT The oligonucleotides are useful for genotyping a nucleic acid sample by CC performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or CC oligonucleotides are described for determining the presence, absence or CC diseases by association analysis the genotype of an individual or group of CC assess by association analysis the genotype of an individual or group of CC diseases by association analysis the genotype of an individual or group of CC assess by association analysis the genotype of an individual or group of CC diseased by one or more SNPs. Phenotypic traits include diseases e.g. CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular CC described by one or more SNPs. Phenotypic traits include diseases, cc osteogenesis imperfecta and acute intermittent pophyria. Phenotypic CC traits also include symptoms of or susceptibility to multifactorial cd iseases, including, rheumatoid arthritis, multiple sclerosis, includence of the component is or may be genetic such as autoimmune cc influence of the component is or may be genetic such as autoimmune content of the component is or may be genetic such as autoimmune content processes of which a component is or may be genetic such as autoimmune content processes of the component is or may be genetic such as autoimmune content processes and infection by pathogenic influence and infectio

                      The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenoty correlations to diseases. The present sequence is an example of one the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                               Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (WHED )

                                                                                                                       The invention relates to oligonucleotides used in a method for the detection of the pseudorables virus in a tissue sample from an animal, particularly a pig. The method involves the detection of a 674 bp fragment of the gII gene (AAH78656) in a purified nucleic acid sample derived from the tissue via a nested PCR reaction using primers selected from AAH78657-AAH78666. Pseudorabies virus is a herpes virus found primarily in the swine population, and in its active state causes a disease that is generally fatal to young pigs. The gII gene encodes a glycoprotein that is essential for pseudorabies virus replication in the host. The present sequence represents an inner PCR primer which anneals to nucleotides 836-856 of the pseudorabies virus gII gene sequence and which is claimed for use in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      gII gene; herpes virus; PCR primer; optimised nested PCR reaction; gII generation virus detection.
                                                                                                                                                                                                                                                                                                               Nested polymerase chain reaction (PCR) for detecting the presence or absence of the pseudorabies virus by detecting a highly sensitive recof the pseudorabies virus gII gene in a tissue nucleic acid sample.

Single nuclectide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and
                                                                                                                                                                            Nucleic acids comprising single nucleotide polymorphisms, useful applications such as forensics, paternity testing, medicine, gene analysis and phenotype correlations to diseases such as diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 21
                                                                                                                                                                                                                                                                                                                                                                                         (WHED )

The present invention provides a method of diagnosing a vascular in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombosp

thrombospondin

The present invention provides a method of diagnosing a vascular diseas in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosplerosis, myocardial infarction, coronary heart diagnosis of atherosplerosis, myocardial infarction, coronary heart

a vascular disease

venous

thromboembolism and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism spulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                 Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; variant thrombospondin 1; variant thrombospondin 4; polymorphism; vascular disease; coronary artery disease; fi myocardial infarction; atherosclerosis; stroke; venous thrombospondin 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          06-JUN-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 pulmonary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human gene single nucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thrombosmbolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and
Nucleic acids comprising single applications such as forensics,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atheroscierosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thrombosembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                             Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as Alaborations
                                                                                                                                                                                                                                                                                                                    Key

The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atheroselerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids comprising single nucleotide polymorphisms, useful applications such as forensics, paternity testing, medicine, genuallysis and phenotype correlations to diseases such as diabetes
                                                                                                                                                                                                                                                                                                             Human; variant thrombospondin 1; variant thrombospondin 4; polymorphism; vascular disease; coronary artery disease; for myocardial infarction; atherosclerosis; stroke; venous thrombospondin 1; variant thrombospondin 4;
                                                                                                                                                                                                                                                                                                                                                                 Human gene single nucleotide polymorphism #2480.
                                                                                                                                                                                                                                                                                                                                                                                             06-JUN-2001
                                                                                                                                                                                                                                                                                                                                                                                                                     AAF97719;
                                                                                                                                                                                                                                                                                                                                                                                                                                               AAF97719 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example;

The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular disease, venous thrombosembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification

The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thrombosmbolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      acid (1) from ryegrass or fescue species including a simple sequence crepeat (SSR), having 2 or more tandemly repeated nucleotide core elements 2-6 nucleotides in length. Also included are a nucleic acid primer contains of ryegrass or fescue genomic DNA enriched for SSR by preparing a cidentifying clones in the library containing SSR, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a method for DNA profiling grass or cereal species varieties by assessing variation between SSR varieties and testing the purity of grass or cereal seed batches by assessing variation within seed batch of an SSR. The SSRs may be used in the selection of genes in grass or cereal breeding, for profiling grass or cereal species variation, the present constitution of details, and for DNA profiling the purity of grass or cereal seed batches, and for DNA profiling the purity of grass or cereal section of genes in grass or cereal breeding, for profiling grass or cereal section of genes and for testing the purity of grass or cereal section of genes varieties, for testing the purity of grass or cereal seed batches, and for DNA profiling to establish the constitution of genes and for DNA profiling to establish the grass or cereal seed batches, and for DNA profiling to establish the grass or cereal seed section of genes in grass or cereal breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

Single nucleuric purpose. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, verous thrombosembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also
                                                                                                        Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is a PCR primer used in the isolation of human CC polynucleotides which are useful in gene therapy, and for diagnosing a CC pathological condition or a susceptibility to it. In particular, the polynucleotides are useful for modulating gene expression in CC pathological are useful for modulating gene expression in CC chromosome identification. The polynucleotides are useful for CC chromosome identification. The polynucleotides are useful for CC chromosome identification or antisense DNA or RNA, or identifying individuals from CC minute biological samples using DNA-based identification techniques. The CC polynucleotides can also be used as an alternative to restriction CC fragment length polymorphism (RFLP), by determining the actual base-by-base DNA sequences of selected portions of an individual's genome. The CC polynucleotides may also be used as molecular weight markers on Southern CC polynucleotides are also be used as molecular weight markers on Southern CC polynucleotides, or as an antigen to elicit an immune response. The CC polynucleotides or useful in diagnostic procedures to detect a disorder. CC The polynucleotides and polypeptides are useful for preventing, treating or ameliorating immune system disorders, genetic disorders, cancers, some autoimmune disorders, or infections. The polynucleotides and polypeptides are useful for adifferentiating, proliferating or attracting cells, care also useful for differentiating, proliferating or attracting cells, cor preservative.
                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

```
The invention relates to a substantially purified or isolated nucleic CC acid (I) from ryegrass or fescue species including a simple sequence crepeat (SSR) having 2 or more tandemly repeated nucleotide core elements CC 2-6 nucleotides in length. Also included are a nucleic acid primer suitable for amplifying an SSR, identifying (M1) an SSR by preparing a CC library of ryegrass or fescue genomic DNA enriched for SSRs and CC or fescue genomic DNA enriched for SSRs and CC or fescue genomic DNA enriched for SSRs that is closely cassociated with the gene such that the SSR in the breeding, a comethod for DNA profiling grass or cereal breeding by identifying an SSR that is closely cassociated with the gene such that the SSR and the gene are comethod for DNA profiling grass or cereal species varieties by assessing variation within seed batche of an SSR. The SSRs can be used in the selection of genes in grass or cereal breeding, for companies or cereal seed batches, and for DNA profiling the purity of grass or cereal seed batches, and for DNA profiling to establish the cCC distinct identity, uniformity and/or stability of a cultivar. The present content is a ryegrass or fescue SSR

                                                                                                                                                                                                                                                   identifying and localising dog genes, since it covers approximately 80 % of the dog genome and provides a dense map integrating different types (i.e. Type I and Type II) of markers. The map and the dog genome markers (or complementary sequences) are especially useful to identify genes responsible for phenotypic and behavioural traits in dogs, to identify morbid genes, to analyse diseases and identify implicated genes in such diseases and their alleles, and to study dog pedigrees. They may also be useful for isolating corresponding human gene sequences e.g. genes involved in genetic diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New radiation hybrid map of the dog, Canine familiaris, for e.g. identifying genes implicated in phenotypic and or in genetic diseases and for studying dog pedigrees.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          mycobacteria, e.g. tuberculosis and leprosy) or cancer (particularly melanoma, especially where used as adjuvant therapy in combination with known antitumour agents). The present sequence represents a PCR primer used to detect Valpha14 T cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 21 BP; 7 A; 8 C; 4 G; 2 T; 0 U; 0 Other;
                                                                                                                                                                                                 Sequence 21 BP; 4 A; 5 C; 5 G; 7 T; 0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a radiation hybrid map of the dog (Can familiaris) genome comprising the genome location of a marker selected from AAA66139 to AAA66942. The radiation hybrid map is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 1; Page 85; 87pp;

The polymorphisms are associated with obesity, especially diabetes mellitus associated obesity. They polymorphisms may be identified and analysed to determine whether an individual is susceptible to obesity and may be use as the basis for targeted design of drugs to treat obesity. The present sequence was used in the identification and amplification of UCP3

The specification describes NIT1 sequences. The human and mouse NIT1 genes are members of an uncharacterised mammalian gene family with homology to bacterial and plant nitrilses. The tumour suppressor gene FHIT in D. melanogaster and C. elegans code for fusion proteins in which the Fhit domain is fused with a Nit domain. In mouse and humans, FHIT and NIT are encoded by two different genes, localised on chromosomes 3 and 1 in human and 14 and 1 in mouse. The human FHIT gene at chromosome 3p14.2, spanning the constitutive chromosomal fragile site FRA3B, is often altered in most common forms of human cancer. The NIT1 genes, encoded polypeptides, derivatives and analogues of them, and antibodies are used as diagnostic and therapeutic reagents for the detection and treatment of cancers

```

The present sequence represents a primer used in the isolation of a descrived serine protease. The present invention also describes a tick salivary gland antigen related immunogen and a tick derived cysteine protease. A nucleotide sequence encoding any of the above proteins of the above proteins of the vaccine against tick carried infections for domestic animal much in a vaccine against tick carried infections for domestic animal

Composition containing natural infection or cancer, activated induce a granulomatous response response. killer T cells, useful e.g. for treating by a phosphatidylinositol mannoside to

Disclosure; Page 10; 35pp; French.

The specification describes a pharmaceutical composition that comprises natural killer T cells (NKT) activated by a phosphatidylinositol mannoside (PIM), and a carrier. Activation of NKT by PIM induces a granulomatous-type response, particularly a mucosal response in the case of bacterial infections. This activation is independent of the CDI/T cell receptor pathway and is based instead on the inate immunity mediated by CDI4 and biases the response to Thi type. It is relatively specific, implying an oligoclonal distribution (contrast the polyclonal activation induced by ceramides). NKT are the only Valpha14+ T cells that infiltrate granulomatous lesions. The compositions, and/or PIM alone, are used to treat diseases where a granulomatous-type immune response is desired, particularly bacterial infection (especially where caused by

chemokine receptors, adenosine receptors, bradykinin receptors, central concervous system (CNS) and peripheral nervous and non-nervous system creceptors, CNS and peripheral nervous and non-nervous system creceptors, CNS and peripheral nervous and non-nervous system peptide transmitters, defensins, growth factors, vasoactive peptides and creceptors, binding proteins and malignancy associated proteins. The antisense oligonuclectides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction cand/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. AAP18434 to AAF21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonuclectides and (1) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, activating peptide factors and transmitters, transcription factors,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 14; Page 208; 1592pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        24-MAR-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
                                                                                                                                               AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOS 2882, 2913, 2974, 3015, 3036, 3157, 3277, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the

                                                                                                                                                                                                                                         AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nuclectide sequences. AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

samples. The method comprises performing a nested PCR to amplify a target nucleotide sequence in a purified sample nucleic acid mixture. In the first stage of the nested PCR, a 674 bp region of the Pseudorabies virus gII gene (AAA61490), which encodes a glycoprotein essential for viral replication is amplified. An aliquot of the first stage PCR mixture is then removed and a second target region contained within the 674 bp region is amplified in the second stage of the nested PCR. The first and second stage PCR reaction mixtures are analysed to detect the first and second stage PCR products which will indicate the presence of the virus in the sample. The nested PCR primers are selected from the 674 bp region. The outer, first stage PCR primers are AAA61491 (upper primer) and either AAA61492 or AAA62493 (lower primers), and the inner, second stage PCR primers are elected from AAA61497-A65300 (lower primers). The method of the invention is useful for detecting pseudorabies in a sample suspected of being infected with the virus. The pseudorabies virus causes a disease which is generally fatal to young pigs. Those which survive become
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

The method allow for greater detection of the virus in the latent state, particularly within tonsillar tissues, before visible signs of the viral disease evident or after visible signs of the disease have dissipated. Sequer AAA6(1491-A6(500 represent the PCR primers which may be used in the mof the invention. The present sequence represents an inner upper PCR primer which may be used in the second stage of nested PCR
                                                                                                                                                                                          invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAS6579 to AAS77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of where a contract of the targets for the development of where a contract of the targets for the development of where a contract of the targets for the development of where a contract of the targets for the development of where a contract of the targets for the development of where a contract of the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

               Antisense polynucleotides targeted to the ELK-1 nucleic acid molecule AAZ06571-206607 inhibit the expression of ELK-1. Sequences AAZ06571-206607 all cause at least 30% inhibition of ELK-1 expression. The antisense sequences can be used to inhibit the expression of human ELK-1 in human cells or tissues in vitro. ELK-1 uses a bipartite recognition mechanism mediated by both protein-DNA and protein-protein interactions to regulate genes by direct and indirect DNA binding and has been shown to control various signal transduction pathways and other cell functions including apoptosis. This means that antisense compounds inhibiting expression of ELK-1 can be used to treat diseases associated with its expression in animals, particularly humans and to prevent or delay the formal of the control various specific to treat diseases associated with its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     for detection and gene therapy for breast and ovarian cancers. They can be used in methods for monitoring disease progression, for determining patients suited for gene and protein replacement progression, or for detecting the presence or quantifying the amount of a tumour growth inhibitor following such therapy. The BRCA2 protein, polypeptides, their functional equivalents, antibodies, and PNs may also be useful in the study of the characteristics of BRCA2 proteins, such as structure and function of BRCA2 in oncogenesis or subcellular localisation of BRCA2 protein in normal and cancerous cells. AAX33001 to AAX33097 represent PCF primers used in the amplification of the human BRCA2 gene
                                                                                                                                                                                                                                                                                                                                                       PCR primers AAZ06609-Z06610 are used to amplify the human ELK-1 seque AAZ06608. Human ELK-1 also known as p62TCF is a member of the ternary complex factor subfamily of Ets-domain transcription factor proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human ELK-1; p62TCF; Ets domain transcription factor protein; apoptosis; expression inhibition; infection; inflammation; tumour formation; diagnosis; phosphorothicate; antisense compound; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SXC
The present invention describes a new composition comprising an antisense CC oligonucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergie, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, compared airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating ce.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONs break down with the crelease of deoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the nucleotide sequences given in the sequence listing from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           course of the invention to produce the retroviral packaging plasmids of the specification, which are used in methods for transduction of mammalian target cells with foreign genes. The methods and products can be used for the highly efficient transduction of mammalian cells, continuity for human gene therapy. The methods and products provide novel optimised transient expression plasmids (designated KAT) for production of retroviral virions in which high steady state levels of retroviral packaging functions and packageable vector transcripts are produced following introduction of KAT plasmids into mammalian cells capable of efficient transient transfection and expression, in the absence of plasmid replication of viral vector and packaging function plasmids. The absence of plasmid the potential for production of high tire virions while minimising the potential for production of high creplication competent retrovirus by recombination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

          The present primer is used as a PCR primer and a probe in the course of the invention, to create the vectors described in the specification. The specification describes a retroviral vector pDRTD4.2 for transduction mammalian cells. The vector comprises, in the 5' to 3' direction, a mammalian cells.
                                                                                                                                 Replication defective retroviral vectors - target cells for the expression of foreign gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Retroviral vector; pDRTD4.2; gene expression; mammalian cell transduction; gene therapy; PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PCR

The present invention describes genomic DNA which contains a BRCA2 gene where the first 12 nucleotides beginning exon 5 are 5'. TCCTCTTGTTCT-3' at in sequence (I) (see AAX03249), where nucleotides numbers 5782-5790 are GTTTGTGTT as in sequence (IV) (see AAX30255), and where the last 20 nucleotides encoding exon 15 are 5'.CTGCGTGTTCCATAAACAG-3' as in sequence (II) (see AAX30251) and the first 20 nucleotides beginning exor 16 are 5'.CTGTATAACGGCGTTTC-3' as in sequence (II) (see AAX30253). Products and methods from the present invention can be used for identifying mutations in the BRCA2 gene leading to predisposition or higher susceptibility to breast or ovarian cancer. They can also be used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to methods of determining a functional allele composite of a gene in a population. Functional allele profiles comprise the commonly occurring alleles in a population, and the relative confrequencies at which such alleles of a given gene occur. The methods are used to identify and determine the frequency of the functional alleles of genes which display extensive allelic heterogeneity, particularly those might be made to cancer. CFTR associated with between the BRCA1 gene associated with breast cancer. CFTR associated with cystic fibrosis, dystrophin associated with Duchenne muscular dystrophy and Becker muscular constructions, and post associated with Firaumenia syndrome. The methods can consist the such as breast cancer, neurofibromatosis, and hereditary non-consist, such as breast cancer. Identifications which may be implicated in the consesser. Sequences AAX32001-172 represent primers for determining the functional allele profiles of various genes. The primers are specific for genes such as MSH2 gene, MLH1 gene, BRCA1 gene, BRCA2 gene and BAP1 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Best

The novel NBC proteins and nucleic acid sequences may be used to treat pathological processes including water retention, increased blood pressure, chronic respiratory and metabolic acidosis, inflammation, cell proliferation, cancer, sperm activation/inactivation, hydroencephaly, epilepsy, glaucoma and colitis. Members of the NBC family of proteins can be used (i) as a target to identify agents that block or stimulate NBC mediated ph regulation, (ii) as a target or bait to identify and isolate binding partners that bind NBC, (iii) in methods to identify agents that block or stimulate activity of an NBC protein, and (iv) as a target to assay for NBC modiated activity. Anti-NBC antibodies are also useful as modulators of NBC activity, useful in immunoassays for detecting NBC expression/activity and for purifying an NBC protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The specification describes antisense oligonucleotides (AAX52869-X55271) directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences AAX55272-74. These multiple target oligonucleotides (specifically AAX55180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vascomstriction, inflammation, allergic rhinitis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              acute asthma; allergy; asthma; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; pulmonary hypertension; pulmonary vasoconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma; colon cancer; breast cancer; lung cancer; pancreatic cancer; colon cancer; breast cancer; lung cancer; pancreatic cancer;
                                                                                                                                                                                                                                                                                                                                                                          hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as well as all types of cancers which may metastasize or have metastasized to the lungs, including breast and prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                 acute asthma, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukemias, lymphomas, carcinomas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            17-SEP-1997;

The primers are used in a method which involves the isolation of a dihydrofolate reductase (DHFR) protein encoded by KSHV ORF 2. KSHV is a new human Herpesvirus (HHV8) believed to cause Kaposi's sarcoma (KS) which is the most common form of neoplasm occurring in persons with acquired immune deficiency syndrome (AIDS). The DHFR protein is useful for vaccination, prophylaxis, diagnosis and treatment of a subject with Kaposi's sarcoma and for detecting expression of a DNA virus associated with the contraction and for detecting expression of a DNA virus associated with the contraction and for detecting expression of a DNA virus associated with the contraction and for detecting expression of a DNA virus associated with the contraction and for detecting expression of a DNA virus associated with the contraction and for detecting expression of a DNA virus associated with the contraction and for detecting expression of a DNA virus associated with the contraction and for detecting expression of a DNA virus associated with the contraction and for detecting expression of a DNA virus associated with the contraction and for detecting expression of a DNA virus associated with the contraction and for detecting expression of a DNA virus associated with the contraction and for detecting expression of a DNA virus associated with the contraction and for detecting expression of a DNA virus associated with the contraction and the c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              the KVLQT gene. The specification describes KCNQ proteins. These are nervous system-specific potassium channels. In neurons, potassium channels regulate neuronal excitability, action potential shape and firing pattern, and neurotransmitter release. KCNQ modulators may be to treat disorders such as ataxia, myokymia, seizures, Alzheimer's disease, Parkinson's disease, age-associated memory loss, learning disease, Parkinson's disease, age-associated memory loss, learning
                                                                                                                            oligonucleotide can be used to treat HIV-1 or HIV-2 infection in a mammal, or inhibit HIV-1 or HIV-2 in a cell. The oligonucleotide has cell toxicity, provokes less immunostimulus than prior art, and is a rich antisense HIV oligonucleotide
                                                                                                Sequence
                                                                                                                                                                                           The present sequence represents a synthetic oligonucleotide sequence antisense to a conserved gag region of the HIV-1 genome. The antisens
                                                                                                                                                                                                                                           Claim 13; Page 63; 64pp; English.

                                                                                                                                                                                                                                     The present sequence represents a synthetic oligonucleotide seque antisense to a conserved gag region of the HIV-1 genome. The antioligonucleotide can be used to treat HIV-1 or THIV-2 infection in mammal, or inhibit HIV-1 or HIV-2 in a cell. The oligonucleotide cell toxicity, provokes less immunostimulus than prior art, and i rich antisense HIV oligonucleotide
                   Human IL-4
                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                   Agrawal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This oligonucletide is complementary to a portion of DNA sequence (see CANV1743) coding for the P30/PHAPI (see AAN84053) of the newly identified CV 3 loop HIV receptor. It is used as a sense primer, together with an CC antisense primer (see AAV71752) in a PCR amplification of P30/PHAPI CC reverse-transcribed mRWA. The V3 loop HIV receptor consists of an CC association of 3 proteins, named P95/mucleolin, P40/PHAPI and P30/PHAPI CC (see AAW84052-54). A method for screening molecules that modulate the CC expression of the receptor comprises: cultivating cells transfected with CC anucleotide sequence encoding P95/mucleolin, P30/PHAPI or P30/PHAPII, CC placed under the control of its own promoter; bringing the cells into CC contact with a test molecule; and quantifying expression of the CC P95/mucleolin, P30/PHAPI or P40/PHAPI e.g. by quantitative PCR using the CC primers provided (see AAV71749-54). Active molecules that have the CC ability to alter and/or prevent the binding of the HIV receptor to the CC HIV retrovirus can be used in pharmaceutical and diagnostic compositions of invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC A method has been developed of defining a set of compounds that modulate CC the expression of a target nucleic acid (tNA) sequence via binding of the CC compounds with the tNA sequence. The method comprises generating a CC library of virtual compounds in silico according to defined criteria, and CC evaluating in silico the binding of the virtual compounds with the tNA cC according to defined criteria. Also described are: (1) a method of CC defining a set of oligonucleotides (ONS) that modulate the expression of a tNA sequence via binding of the ONS with the tNA sequence comprising CC generating a library of virtual compounds in silico according to defined CC criteria, and evaluating in silico the binding of the virtual ONS with the tNA sequence via binding CC the tNA according to defined criteria; and (2) a method of defining a set CC compounds that modulate the expression of a tNA sequence via binding CC the compounds with the tNA. The methods can be used for the generation CC and identification of synthetic compounds having defined physical, CC chemical or bioactive properties. Information gathered from assays of compounds is used to identify nucleotide sequence—based technologies, e.g. CC antisense drug discovery and target validation. AAZ40852 to AAZ41220, and CC the present invention.

PCR utilising a series of primers (see AAV32721-34) was used to isolate overlapping GST-pi DNA segments from SuperCos-GST-pi clone, a genomic library of human glioblastoma multiform cell line MGR-3 genomic DNA. The products were used to determine the full-length sequence (see AAV32717) of the GST-pi gene. Novel methods for the diagnosis, prevention and treatment of tumours, are based on the differential involvement of variant forms of GST-pi (see AAW49013-14)

The vector comprises the double-stranded DNA molecule and at least one oligonucleotide that is linked to a targeting system and can form a triplex with a specific sequence within target cell or tissue. This sequence represents an example of an oligonucleotide able to form a triple helix with the target DNA. The vector is used to deliver therapeutic DNA (including antisense sequences or ribozymes) for gene therapy. e.g. sequences that encode enzymes, blood factors, hormones, tumour suppressors, also antigenic peptides for use as vaccines or immunotherapeutic agents for control of microbial or viral infections, or
